Purpose

The purpose of clinical trials is to answer scientific questions. Therefore, these studies follow strict, scientific standards which protect patients and help produce reliable clinical trial results. Clinical trials are one of the final stages of a long and careful research and development process. The process often begins in a laboratory, where scientists first develop and test new ideas. Clinical trials related to drugs are classified into four phases. The trials at each phase have a different purpose and help scientists answer different questions

Every clinical trial has a protocol or study plan that describes what will be done during the clinical trial, how the clinical trial will be conducted, and why each part of the clinical trial is necessary.

Objectives

To find better ways to prevent, screen for, diagnose, or treat disease.

To show which medical approaches work best for certain illnesses or groups of people.

To produce high-quality data for healthcare decision making

Number of Participants: 227
